Figure 2

1. Remove power from unit. (Use Machine Main Breaker)

Note: FR-SE CBI breaker does not remove power from SE-PW and other PCB's.
Note: If Main Breaker cannot be shut off. Power can be removed by CBI breaker and removal of fuses F1,F2, \& F3. CAUTION:F1,F2,\& F3 are live at this time. Fuses are usually located inside of base unit on the line filter. Refer to Figures 17 to 22 (FR-SE Base).
2. Removal of $\mathrm{SE}-\mathrm{CPU}$ card. (Refer to Fig. 2)
(1) Remove the connectors for external connection of orientation detector, PLG, etc. On CPU1: CON4 and CON2. On CPU2: CONA, CONAA, CON2, and CONC. To SE-IO card remove CON11 and CON12. Unscrew power supply wires P5A and DGA. Note: Honda connectors have screws and retaining clips. (2) Remove the card while compressing the card installation spacer claws.
3. Removal of SE-iO card. (Refer to Fig. 2)
(1) After removal of the CPU card connectors according to the above procedure, remove the load/speed meter wiring from TB2, CON1, and CON3 of the I/O card.
(2) Remove CON101, CON102, and CON103 on the rear of the hinge panel.
(3) Remove the small hinge panel upon which the CPU card was installed.
(4) Remove the screws fixing the I/O card, and then pull out the upper guide strongly and pull the I/O card from the SE-PW connectors. (CON21 - CON24).
4. Remove the SE-PW power supply. (Refer to Fig. 2)
(1) Remove the CPU card and I/O card according to the above procedure, .
(2) Remove the three 200 volt ACpower wires RO,SO, \& E from the terminal block located on the base of the unit. Note: E is green and RO\&SO are white with no polarity. (3) Remove the screws on the back of .the hinge holding the SE-PW and the remove the SE-PW unit.
5. Assembly of hinge panel.
(1) Install the new cards in the reverse order of the removal procedure.
Important Note: After replacement, confirm that all screws and connectors are tight and correct. Also verify positive insertion of the connectors.
Applying Power:

1. After replacement, all specific adjustment procedures should be observed. Especially current transformer
offsets, meter calibration, and orientation.
2. Verify that EPROM's and switch settings are correct.
3. Optional: Verify that base driver waveforms are correct.
4. Verify spindle operation:
(1) Confirm full speed range in each gear forward and reverse.
(2) Confirm orient operation in each gear (Including ATC operation). Verify alignment before attempting ATC.

## General Instructuions for Changing FR-SE Hinge

Before exchanging the FR-SE hinge panel please confirm the following:
(1) Remove the original hinge cover panel and keep it for later installation on the new hinge. This maintains the original $B N$ number on the spindle drive. The $B N$ number tells the service engineer the settings. of the pins, switches and the controller's ratings. Refer to Figure 1 if necessary.

Note: Spindle hinge will have either CPU1 or CPU2, not both.
(2) SE-CPU1 Card: Set adjustments VR1 and VR2 the same as the original card. Set dip and rotary switches SW1 through SW11 the same as the original card. Refer to Fig. 5 for locations.
(3) SE-CPU2 Card: Set shorting pins (PIN11 through PIN13) the same as the original card. Set dip and rotary switches swi through SW15 the same as the original card. Refer to Fig. 6.
(4) EPROM's SE-CPU1 and SE-CPU2: Verify that numbers on the new EPROM labels match the original EPROM. Newer versions of software EPROM's will have a higher number or letter on the label, which is ok. If unsure please call Mitsubishi and verify ERPOM version level. Please remove and install the original EPROM's in the new CPU card if the ROMI and ROM2 sockets are empty. Use care in removing EPROM's and caution in installing EPROM's. Do not install upside down, as this will damage the EPROM. Refer to Figure 15 for detail.
(5) SE-IO Card: Set shorting pins (PIN1 through PINS) the same as the original card. Do not make any adjustments other than those specified in the instructions. Refer to Fig. 7.
(6) Optional: Test base driver waveforms'before restoring full power (CBI OFF). This test should be performed if output transistors were damaged and replaced or suspected of being damaged. Refer also to Testing Output Transistors, Diode, and Capacitor. See Procedure for Checking Base Driver Waveforms.
(7) After installing $\mathbf{F R} \mathbf{- S E}$ hinge panel please readjust the offsets for the DC current transformers. Refer to Current Transformer Offset Adjustment Procedure.
(8) Confirm full speed range in all gears FWD and REV.
(9) Confirm alignment of spindle at orient in machines that require it for mechanical operations such as ATC. This may involve measuring the spindle orient position relative to axis movement as specified by the machine manufacturer. Confirm orientation in each gear. (Including ATC.)

## Current Transformer Offset Adjustment Procedure FR-SE

(1) Offsets should be adjusted with zero current. This is done, by switching CBI breaker OFF on FR-SE and disabling the BREAKER TRIP alarm(*) caused by CB1. Refer to Fig. 3 or 4 for location of CB1. (Note that up is OFF.)

Note: Computer Numerical Control (CNC)....OF F FR-SE Fuses F1, F2, \& F3..............I N (GOOD) Machine Main Breaker.................... 0 N Pin 4 (FB) on SE-IO card............... 0 N (*) FR-SE Breaker CBI........................ Of F

Note(*): It may not be necessary to disable the breaker trip alarm to complete current transformer adjustments.

Disable CB1 breaker trip alarm by inserting jumper (FB) on Pin 4 of SE-IO PCS. This is located on the lower right corner of the PCB and to the right of the ${ }^{2} 22$ screw terminal. Refer to lower right corner of Figure 7. ASPARE jumper strap can usually be found on the SE-CPU or SE-IO printed circuit boards.
(2) Adjust all DCTC offsets to Ov +/-5mv (Note: +/-10mv is acceptable). Refer to bottom of Fig. 7 for location of adjustments and check points.

(3) After adjustment return spindle drive to normal settings.

Note: CNC
OFF
FR-SE Fuses F1, F2, \& F3..............I $N$
Machine Main Breaker.................... 0 N Pin 4 (FB) on SE-IO card.............. 0 FF FR-SE Breaker CB1 ......................... 0 N

Refer to Figures 17 to 22 (FR-SE Base) for location of fuses.

Output is 256 pulses per revolution of the motor shaft.

PCB (Located in motor)

Amplified signals C?
PA - CH59 \& CH6 $\mathrm{PB}=\mathrm{CH} 62 \& \mathrm{CHS}$
SE-CPU Card

(Signal G
pLG Adjustment Procedure FR-SE
(1) Normally PLG adjustment is not necessary. The PLG should be adjusted in open loop to prevent the spindle drive from responding to PLG signal loss while adjustments are made. Caution: In open loop sudden speed changes can cause damage.
(2) With the CNC OFF. Set SW6-2 OFF (Open loop) and press ST1 (Reset) on the SE-CPU card. Refer to Figure 5 (SE-CPU1) and Figure 6 (SE-CPU2) for location.
(3) Turn the CNC ON. Command the spindle FWD and confirm LED3 CW on the $\mathrm{FR}-\mathrm{SE}$ is ON. If not command REV instead.
(4) Caution: Increase and decrease motor speed slowly in open loop or damage may occur. Bring the spindle motor up to about 1800 RPM slowly in the FWD direction. See note on command RPM vs gear range. Make RPM adjustments manually if possible.

Note: This should be actual motor shaft RPM in CCW direction. (Refer to Figure 9A.) If the machine has gears, the commanded RPM should be compensated or else the spindle motor will be at an RPM greater than 1800 RPM.

Example: (Max. RPM for gear range / Max. motor RPM) x 1800 (4800 RPM/ 6000 RPM) $1800=1440$ Command RPM

Note: If the CNC has a spindle override be aware of its setting. It can also be used to bring the motor speed up and down slowly.
(5) Adjust VR's located on PCB in motor to obtain the waveforms in Figure 9B at PA and PB or Pin 14-\& 16 of CON2. Refer to Figure 8 for locations.

VR1: Offset for APhase VR3: Offset for B Phase
VR2: Gain for APhase VR4: Gain for B Phase
(6) Slow spindle to zero speed. Command spindle REV and verify LED4 CCW is ON. (If not command FWD.) Bring the spindle slowly up to about 1800 RPM and confirm that the waveforms in Fig. 9C are present at $P A$ and $P$. When the motor shaft is rotating $C W$ the output could shift up to $-0.3 v .(-0.4 v$ max.)
(7) Slow spindle to zero speed. Set SW6-2 ON (Closed loop) and press ST1 on SE-CPU card. Refer to Fig. 5 or Fig. 6.
(8) If the correct output cannot be obtained in (5) \& (6) it may be necessary to adjust the gap between the sensor and the detection gear. Refer to Fig. 8 and the FR-SE Maintenance Manual. Then repeat adjustment procedure as necessary.
(9) Check PA and PB output waveforms at 0 to Max. RPM in FWD and REV to conf-irm that they are within the envelope shown in Figure 10. Specifically Max. RPM in FWD and REV.

Figure 10A

## Magnetic Sensor Adjustment Procedure SE-CPU1

Note : If VR1 and VR2 are set the same as the original hinge when a new hinge is installed, adjustment is probally not necessary. Adjustment would be necessary if magnet or sensor is replaced or the gap is adjusted.
(1) Refer to FR-SE Maintenance Manual for information on mounting magnet, sensor, and amplifier. Be sure gap, magnet, and sensor positioning meet specifications if the following adjustments do not work properly.

Note: Do not attempt tool change with ATC until- all adjustments are made and physical alignment is checked.
(2) Record the position of rotary switch SW10 (Orientation speed setting) for later use. Then set SW10 to position 2 ( 60 rpm ) and set dip switch SW6-1 to OFF (Orient test). Then press ST1 (Reset). Refer to Fig. 5 or Fig. 6 for loactions.

Note: -Adjustments of magnetic sensor output should be made at spindle RPM's of 80 RPM or less.
(3) Turn VR2 (Sensitivity) fully counter clockwise. Refer to Fig. 5 or Fig. 6 for location of adjustments and check point. Method 1 (Oscilloscope): Press ST2 and adjust VR2 until1 $20 \mathrm{Vp}-\mathrm{p}$ is obtained between CH53 and DGA at orient. Note that the $20^{\circ} \mathrm{Vp}-\mathrm{p}$ waveform occurs only momentarily at orient. Refer to Figure 10A for waveform. Repeat Method 1, as necessary, increasing VR2 a half division each time until $20 \mathrm{Vp}-\mathrm{p}$ is obtained. If hunting occurs at orient, see $\operatorname{SW4-8}$ setting. Method 2 (LEDI1): Press ST2 and adjust VR2 slowly clock-' wise until LED11 lights then stop imediately. LED11 lights only at orient stop the first time and will usually stay on until the next power up or spindle reset. Press ST2 again to verify orientation. Increase VR2 setting a half division to insure adequate signal amplitude. Power 'OFF, then ON or reset spindle and press ST2 to verify orient.
(4) Caution: Adjust VR1 (Position shift) as necessary to avoid any mechanical interference. This may involve measuring the spindle position relative to axis movement as specified by the machine manufacturer.

Example: At ATC, tool changer claw must align with spindle or damage may occur when tools are changed.
(5) After adjustment return SW10 to original position in step 2. Set SW6-1 to ON and press ST1 (Reset) to return the spindle controller to normal. Refer to Fig. 5 or Fig. 6 for location of switches.

Converter Base Waveform: ( 60 Hz.$)$

The converter waveform is visible only when the converter is enabled.
L\&D 18 should be ON. Voltages may vary, Positive range: +1.8v to +2.2v Negative range: $\mathbf{- 2 . 7 v}$ to $-3.5 v$

The above waveform is actually changing betvecn the bottom two waveforms. AtlowRPM's the speed at which the waveforms change slows and is visible.

Note : Waveforms on the $P$ side can not be seen on the oscilloscope at the same time. They do not share a common. It may be helpful to compare the voltages on one transistor to another. Hint: Compare $P$ side to $P$ side transistors and $N$ side to $N$ side transistors.

Figure 11

## Procedure for Checking Base Driver Waveforms FR-SE

This procedure should be used if output transistors were damaged and replaced or output transistors are suspected of being damaged.
(1) Before restoring power to the machine switch CBl OFF This prevents power from being applied to the output transistors. Disable breaker trip alarm by inserting jumper (FB) on Pin 4 of SE-IO Card. This is located on the lower right corner of the card and to the right of the TB2 screw terminal. Refer to lower right corner of Figure 7. ASPARE jumper strap can usually be found on the SE-CPU or SE-IO Cards.
(2) Set dip switch sw6-2 (Open loop) OFF and press ST1 (Reset) on the SE-IO Card. Refer to Figure 7.
(3) Regeneration Transistor Check: (Converter)

1. Connect a shart jumper wire between DGA and the cathode (top) side of D12 in middle of SE-IO Card. See Figure 7.
2. Power CNC ON. Confirm LED18 on SE-IO Card is ON. LED18 lights with converter regeneration.
3. Command the spindle FWD or REV (MO'3 or MO4). Verify that LED2 and LED3 or LED4 on the SE-CPU Card are ON.
4. Check the waveforms at the following check points with an ungrounded (isolated) oscilloscope. See Figure 11 for voltage and duty cycle specifications. Refer to Figure 7 for locations of CH Point and resistor.

| CH50 to right side R146 | CH53 to right side. R155 |  |  |  |  |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- |
| CH51 to right side R149 | CH54 | to | " " |  |  |
| CH52 to right | side R152 | CH55 | to | " " | " |

Note: Leads of the resistors may have coating. Remove coating if necessary before making measurements.
5. Power CNC OFF.
*6. Remove the short jumper wire from DGA and D12.
(4) Generation Transistor Check: (Inverter)

1. Power CNC ON. Verify LED2 is ON.
2. Command FWD or REV. Verify LED3 or LED4 is ON.
3. Input a speed command of about $1 / 10$ of top speed.
4. Check the waveforms at the following check points with an ungrounded oscilloscope. See to Figure 11 for waveforms. Refer to Figure 7 for location of CH Point.

CH44 to right side R128
YCH45 to left side R131
y CH46 to left side R134

| CH47 to right side R137 |  |
| :--- | :--- | :--- |
| CH48 to "" | "" |
| CH49 to " | " |

(5) Power CNC OFF and return spindle controller to normal. PIN4 OFF, SW6-2 ON, and press ST1. If_check OK, turn CBI ON.

Maximum Speed Adjustment FR-SE
Note: Overspeed alarm may be caused by missadjustment.
(1) Set PIN1 (on SE-IO card), SW6-7, and SW7-4 on the SE-CPU card according to the following information. For other capacity/rpm settings (SW7-5,6,7,8) refer to Switch Setting Sheet with the machine. Refer to Figure 5 or 6 for SE-CPU and Figure 7 for SE-IO PCB layout.

Note: Motor base speed, top speed, and Kw capacity can be found on the motor name plate.

Standard Motor:

| Base Speed | 1150/1500 | 1150/1500 | 1150/1500 | 1150/1500 |
| :---: | :---: | :---: | :---: | :---: |
| SW7-4 | ON/OFF | ON/ OFF | ON/ OFF | ON/OFF |
| Top Speed | 3450/4500 | 4600/6000 | 6000/8000 | 8000/10000 |
| PILL | B/ B | A/A | A/A\&B | A\&B/A\&B |
| SW6-7. | ON | OFF | OFF | OFF |
| New SE-IO | VR6 | VR6 | VR6 | VR6 |
| Old SE-IO | VR7 | VR6 | VR6 | VR6 |

Note: On old SE-IC PCB set VR7 to $S$ (Middle of rotation) if A\&E is specified for PIN1 above. In step 2 adjust VR7 in place of VR6 were specified in the above table. VR7 is no longer used on new SE-IO Cards.
(2) SET SW6-6to OFF and press ST1 (Reset) on the SE-CPU PCB. Adjust VR6 fuliy clockwise and then counterclockwise to obtain 10v at CH34 to DGA. Refer to Figure 7 for location of adjustment and check point.

Alternate Method: This method has low accuracy and should only be used for rough adjustment. For EPROM versions 480-F/ 490-C and later. Adjust VR6 fully clockwise and then turn it slowly counter-clockwise until LED17 lights. LED17 lights when voltage at CH3 to DGA is 9.8 to $9.9 v$.
(3) The speed meter should be reading $\max$ RPM at this time. Adjust VR14 to set Maximum speed reading on the speed meter. If fixed output is used or encoder, VR14 will have no effect on the meter reading or display. Refer to Meter Output Adjustment Procedure for more information.
(4) Return SW6-6 to the ON position and press ST1 (Reset) on the spindle drive to return it to normal operation. Confirm switches and pins (PIN1, SW6-7, and SW7-4,5,6,7,8) are set according to the Switch Setting Sheet for the spindle controler on that machine. If not correct, record setting difference and repeat adjustment procedure.

## Meter Output Adjustment FR-SE

(1) These adjustements, if used, should be made under normal operating conditions for the spindle. (CNC ready)
(2) Some machines use the fixed voltage outputs for which there is normally no adjustment on the spindle drive. (See step 3.) Outputs are available from CON1 and/or TB2. Refer to CON1/TB2 connection table below.

Note: Some machines used the encoder feedback for spindle rpm display and the spindle speed meter output is not used by the CNC.

CON1/TB2 Connections:
CON1-1 /LMO . . ..Fixed Load Meter Output $3 v / 10 v / 120 \%$ (See note)
CON1-2 /SMO. . ..Fixed Speed Meter Output 10v/MAX RPM (CH34)
CON1-18/OM.....Common (Ground)
CON1-49/LMI. . ..Adjustable Load Meter Output VR15
CON1-50/ṢM1....Adjustable Speed Meter Output vR14
Note: LMO and SMO are voltage outputs, with current limited by 220 ohms. LM1 and SM1 are 1 ma . current outputs, with adjustment range of approximately .6 to 1.5 ma .

Note: Some adjustement may still be necessary on the machine or CNC side even when fixed voltage outputs are used.
(3) CNC ON and READY (LED2 on SE-CPU ON). Set Dip Switch 6-6 (Meter calibration) OFF and press ST1 (Reset) on SE-CPU card. Refer to left center of Fig. 5 for CPU1 and Fig. 6 for CPU2. OPTIONAL: Verify LMO is $3 v$ or $10 v$ and SMO is $10 v$ when disconnected. If fixed outputs are incorrect refer to the following note and Maximum Speed Adjustment Procedure.

Note: If the speed meter output is incorrect, check ch34 for 10v to DGA. If CH34 is high or low, refer to Maximum Speed Adjustment Procedure. Misadjustment can cause over speed alarm. Load meter output can be set for $3 v / 10 \mathrm{v}$ by dip switch SW7-3. ON is 10v/120\% and OFF is $3 v / 120 \%$.
(4) The Load meter should read $120 \%$ and Speed meter, if used, should read Maximum RPM. This is usually full scale on the external panel meter/s. Adjust VR15 and VR14 respectively if LM1 and SMI are used for the correct meter reading. Refer to bottom right of Fig. 7 for adjustment.location.

Note: Outputs may come from CON1 instead of TB2.
(5) After adjustment is complete, set SW6-6 ON and press ST1 (Reset) on SE-CPU or power CNC OFF/ON to reset if CNC provides a reset signal to the Spindle Drive. (Normal)

Figure 12

The waveforms shown are with PIN5 OFF (18Kw drive or larger). When PIN5 is on these waveforms may saturate and vary from full on to full off. (Openloop) Example waveforms showing 26 usec. interlock for output transistors.

Note: Times and voltages may vary with differrent drives.

Does not show current feedback or complece error signals. Voltages and timming
may be differrent. Condicions: TAW $=2800 \mathrm{~Hz} .$, Mocor frequency approx. $1.55 \mathrm{~Hz}, 4670$ :

## Adjustment of Converter Enable Circuit FR-SE

Note: If VR8 and VR9 are misadjusted the converter will not turn off (LED 18 ON) or the converter will not turn on quick enough and cause damage to output transistors or capacitors.
(1) The drive should be in ready condition only. Verify LED19 and LED20 are ON and LED18 is OFF. The condition of converter enabled indicator (LED18) and base transistor cutoff indicator (LED19) may be incorrect if VR8 \& VR9 are misadjusted.
(2) The basic adjustment involves adjusting VR8 \& VR9 to obtain equal positive and negative voltages at CH 42 and CH 43 . Repeat adjustment until equal. Refer to Figure 7 for location of check points and adjustments. Use the following table as a guide for approximate voltages that should be obtained.

| P-N DC | CH42 P-N | CH43 tine | Approx. VAC |
| :---: | :---: | :---: | :---: |
| Voltage | VRE | VR9 | Input at CB1 |
| 272v. | +6.80 V. | .-6.80v | . 192 v |
| 274 v | . +6.85 v | -6.85v | 194 V |
| 276v. | . +6.90 v | -6.90v | 195 V |
| $278 v$ | +6.95v | -6.95v | 197 v |
| 280v | . +7.00 | .-7.00v | . 198 v |
| 282v. | +7.05v. | -7.05v | 199 V |
| 284v. | +7.10 V | . -7.10v | . 201 v |
| 286v. | +7.15 v | .-7.15v | . 202 V |

| 334 v . | . +8.35 v . | .-8.35v... | . 236 V |

Note: This table is based on DC output of 400 v generating 10 v at CH42 and an AC input of 200v producing $-7.07-\mathrm{v}$ at CH 43 .

EPROM Insertion

Bent Pins:

Details of the Nameplate:

Figure 15

## Instructions for Changing FR-SE EPROM

(1) Please make sure that all power sources are turned off before changing EPROM. Because CBI in the spindle drive does not remove power from the circuit boards it is necessary to turn off the machine main breaker.
(2) Note the position of the name plate and the locations of the EPROM's in Figure 15. The SE-CPU card is located just behind the front panel. Two EPROM's (ROM1 \& ROM2) are located on the upper left side of the CPU card.
(3) Remove the EPROM very carefully with a ROM puller. Be sure not to bend the pins on the EPROM. The EPROM can be removed by prying very carefully on the corners between the EPROM and the socket with a small flat screw driver. Do not pry against or damage the printed circuit board.
(4) Confirm the version on the EPROM label and note number for proper socket location. Example: Al in ROM1 socket.
(5) Locate notch or dot on EPROM and align that end of the EPROM with the notch on the printed circuit board outline. Refer to Figure 15 for detail. Carefully start all pins of the EPROM in the socket. Then apply firm pressure to seat the EPROM in the socket. Support the printed circuit board so that excessive bending does not occur. In the case of a new EPROM it may be necessary to bend all of the pins at right angles to the EPROM case before attempting insertion.
(6) Make sure all of the pins on the EPROM are properly inserted in the socket. Inspect for tilting of the EPROM and pins bent under the EPROM or bent out. Refer to Figure 15 for detail.
(7) Please record the machine serial number, the new EPROM version from the label, and the information form the spindle drive nameplate. Please return this information and the old EPROM's to Mitsubishi.
(8) Refer to Figure 15 for location and details of the nameplate.

Note: Always keep the original hinge cover panel with the machine. This keeps the above information correct for that machine which is necessary for proper servicing of the drive.

CONVERTER TRANSISTORS TRR, TRS, \& TRT

Testing Output Transistors, Diode, and Capacitors FR-SE
This is a basic resistance test designed to pinpoint defective components with minimal connection removal.. It will indicate a shorted diode or output transistor. The normal meter reading obtained will vary with meter type and transistor type or lot. Refer to Figure 16 for location of components and check points in the following procedures.
(1) Turn machine main breaker OFF. Switch spindle CBI OFF as an additional precaution. Up is OFF. It is located on the bottom left of the spindle controller.
(2) Disconnect motor leads from $U, V$, and $W$. Located on the bottom right of the spindle controller.
(3) Capacitor Check (C1): Locate large blue capacitors with shorting bars connecting them in parallel. Check the condition cf the sight glass on the top of each capacitor. If it is damaged or blown the capacitor is bad and needs to be replaced. Be sure Cl is discharged before removal.
(4) Converter Section: Locate (P) and (N) on Cl. Locate R3, S3, and T3 on contactor MC1. Refer to Figure 16. Discharge Cl through a 100 ohm 10 w resistor across (P)\&(N) or wait until zero volts is measured across (P)\&(N). This is approximately one minute. In the following tests if a reading of SO ohms or less is obtained a diode or transistor is bad. Use an ohmmeter to check the resistance between the following points.

| Test | Point | Bad Device | Test Point | Bad Device |
| :---: | :---: | :---: | :---: | :---: |
| P to | R3 | .TRR or D1 | N to R3 | ..TRR or D1 |
| to | S3 | TRS or D1(D2) | N to S3 | TRS or Di(D2) |
| to | T3 | TRT or D1(D3) | N to T3 | TRT or DI(D3) |

(5) Inverter Section: Locate (P) and (N). on Cl. Locate U,V, and $W$ on TB3 motor terminal. Refer to Figure 16. Discharge Cl, see step 5. In the following tests if a reading of 50 ohms or less is obtained a transistor is bad. Use an ohmmeter to check the resistance between the following points.

Test Point Bad Device
P to u....... $\mathbb{T R} u$
P to v........TR v
P to w........TR w

Test Point Bad Device
N to U........TRU
N to V........TRV
N to $\mathrm{W} . . . .$. . TRW
(6) After changing transistors please check base driver waveforms. See Procedure for Checking Base Driver Waveforms.
Return all connections and breakers to normal.
Note: Output transistor have an internal diode connected between C \& E. Removing CON101 and CON102 isolates output transistors from drivers on the SE-IO card. Removing R4, S4, \& T4 isolates converter diodes from converter transistors.

## CHAPTER 1 GENERAL

### 1.1 OBJECTIVES OF MANUAL

The FR-SE series of AC spindle drive units are energy-conserving DDC inverters which have been developed to drive machine tool spindles. They operate stably over, a wide speed range with a high response and yet with low vibration and noise levels and their braking energy is regenerated in the AC power supply. This manual describes the maintenance procedures for such units and it centers on regular inspections and troubleshooting. 1.2 SAFETY MEASURES AND MAINTENANCE PERSONNEL Listed below are the checkpoints which should be strictly adhered to during maintenance and adjustments in order to assure safety.
o Control units should be started up, maintained and inspected by qualified electricians. It is dangerous for nonqualified personnel to touch these units.
o When handling a "live" control unit, remove all rings, watches, tie-pins and other metallic objects from your person.
o Electric shocks sustained from the units can result in death.

Regardless of whether or not the power supply is grounded, high voltages are supplied to various locations in the unit and so particular care should- be taken in the selection and use of the test equipment.

When attaching the test equipment to the item under test, the test personnel should take care not to touch any units wilich are grounded. Generally speaking, the chassis of the
test instruments must not be grounded for testing. Consequently, high voltages may pass between ground and the chassis of a test instrument during testing and so particular care should be taken when operating the units while adjusting or repairing them.

0 Do notwearloose apparel which may be caught up by rotating objects when approaching a drive unit which is operating.

0 Do notremoveor replace anyofthe circuit boards while power is being suppliedtothe drive units or while they are operating. Failure to heed this caution may result in damage.
c Do not touch the controller immediately after the power has been switched off. Proceed to maintain and inspect after checking that power lamp LED20 (SE-101 card) has gone off. (Wait at least 3 minutes.)

### 1.3 STORAGE

When equipment is not to be installed or used immediately, store it away in a clean and dry environment at a suitable temperature and take care not to allow damp or vapor to enter inside the control units. Any damp, vapor or dust finding its way inside the equipment invites deterioration in the insulation. When suspending operation of the equipment for a long or short period of time, take care to maintain the same environment as that effective during operation. Depending on the conditions, a heater may prove useful.

### 2.7 AC SPINDLE MOTORS

(1) Standard specifications

| Output power | Continuous (KW) rating | 3.7 | 5.5 | 7.5 | 11 | 15 | 18.5 |

| Weight <br> ( kg ) | Open type unit | 25 |  | 30 | 37 | 48 |
|  | Closed type unit | 30 |  | 36 | 56 |  |
| Total heat generation ( $W$ )(Note 2) |  | 340 | 400 | 490 | 590700 | 1810 |
| Main circuitry ststen |  | Transistorized sinusoidal wave PWM inverter |  |  |  |  |
| Control system |  | Vector control, digital closed loop control, speed feedback vith pulse generator |  |  |  |  |
| Braking system |  | Power regenerative braking |  |  |  |  |
| Speed control range |  | 35 - 10000 RPM |  |  |  |  |
| Speed fluctuation rate |  | Max. 0.28 of maximum speed (at 10-100 load fluctuation1 |  |  |  |  |
| Speed cowmands |  | Digital commands: binary 12-bit or BCD 2digits (Note 1) Analog commands: +10V max. (approx. 10 kilohms input impedance) |  |  |  |  |
| Ambient temperature/humidity |  | -5-55* ${ }^{\circ} \mathbf{4 5}$ - $85 \%$ |  |  |  |  |
| Atmosphere |  | No noxious gases or dust (environmental resistancc performance conforms to JEM1103 grade C) . |  |  |  |  |
| Vibration |  | Max. 0.56 |  |  |  |  |
| Standards conf ormed to |  | I E C. |  |  |  |  |
| Cooling |  | Air cooling with fan |  |  |  |  |

Note 1: Selection between the binary 12-bit and BCD 2-digit formats is enabled by the internal DIP switches and that between the digital and analog commands is enabled by external inputs.
Note 2: This is the total amount of heat generated at the continuous rating. In the case of the enclosed type unit, the amount of heat generated outside the panel is approximately equivalent to (total heat generation - 120) x 0.7 'w').

| Name | Function | Description |
| :---: | :---: | :---: |
| OVER HEAT (MOTOR) | Overload protection | When an overload occours or when the blower motor stops And the motor itself overhears, the base amp. iscut off And the maincircuitry contactor is set OFF. |
| EXCESSIVE SPEED ERROR | Excessive speed error | When the error between the command speed And current speed becomes excessive. the base amp.1s cut off and the main Circuitry coneactor is set Cre. |
| breaker trip | Short-circuit grounding procection | When a high current flows to the main circuitry, the base amp. is cut off and the main circuitry contactor is set OFF. |
| Phnse coss | Phase loss protection | The main circuitry contactor is set OFF. |
| EXTERNAL emercency | Extermal emargency stop | After the emargency stop signal has bee.. received from the external source and the wutur has stopper b: regenerative braking, the base Amp. is cut off and the anin circuitery coneaceor is see OFT. |
| OVER SPEPD | iver speed protection | When the speed - xc*eds*11Sr of the maximin spud, the base amp. is cue off end min circuitery coneactor is set OFF. |
| IOC TRIP (CONVERTER) | Instantancous over current protection | when an over current flows to the converter, the base amp. is cut off and the main circulery coneactor is set OF?. |
| OVER HEAT (CONTROLTER) | Main eireuiery overload protection Air cut-off protection | When the ambiant temperature 13 abnomad or whell in overload occurs or when the are-coobing fan stops and themain circultify elements over heat. the basc amp. is cut off find the maln eqreustry con tactoris set off. |
| UNOER <br> voltage | Main power supply drop protectron | When the supply voleage drops, the base amp. is cut off and the main exreurefy contactor is set Off. |
| OVER <br> (VOLTAGE regeneration) | Maln earcuitey over voltage protection | When An over voltage occurs wheh regeneration of the main circuitry's capacitor voltage, the base amp. is cut off and the main circuitry contactor is set OFF. |
| IOC TRIP <br> (INVERTER) | Instantancous over current protection | When an over current flows to the $1 n-$ verter, the base amp. is cue off and the main elreuitry contactor is set OFF. |
| Note: When any of these protectron functions excepe the external emergency stop signal is aotivated, the base Amp. (che inverter And reqenerative converterlis cut off, the main elrcuitryconcactoris set $O F F$ and the motor stops by free-running. |  |  |

| Function | Applicarion | Decails | oucpuc |
| :---: | :---: | :---: | :---: |
| Load meter signal | Load meter connections | Connect a single-deflection DC 1 mA seter; full-rule and 30 or $10 \mathrm{~V} / 120$, load outputs under a $120 \%$ ( 100 - 120 \% dfuitablt) art obtained. |  |
| Speed meter signal | Spttd meeer connections | Connect a single-deflection DC lma secer; full-scale end 20V/maximum speed outputs at naximen speed aft obtained. |  |
| Zero speed sign 1 | Mach ine inctrlock | An ON-serting contact signal is obtai ned at less than, moror speed of $S O$ rpm or 25 rpm . | Contact/open emiter |
| Up co spttd signal | Answer back to NC | Obeained is a signal which - ctuats cht outut transistors at within $+/-15 \%$ of the set spttd. | Open emitter |

| Orientation (optional function) | Ordencstion | Singlé point posicioning possible for magnetic sensor system, mulciple-point posicioning possible for encoder systen. <br> Scarted by oriencation start signals (ORCl, ORC2); oriencation finish signal is oucpur upon completion. | Contact/open emitter |
| Tor que imicacion | Gear shift, etc. | With gear shifting, etc., the corqut 1 imicasionis temporarily reduced and the spindle motor is operated. <br> During torque limitation, <br> signal for output transistor continuity. | 0 pen emitter |
| Speed detection signal |  | Obtained is a signal which activaces che oucpuc transistors with a motor speed absolute value of less than the prescribed detection level. Speed detection value ranges from $2 \%$ to $58 \%$ in 8t steps and can be sec to any of 8 steps. | Optn emitter |
| Acceleration/ deceleration time constant |  | Acceleration/deceleration of spttd comand is restricted. |  |

### 2.3 CONTROLLER CONFIGURATIONS

The basic configuration of the type FR-SE AC spindle unit is shown below.
(1) Basic configuration
(a) Type SJ AC spindle motor (with speed detector)
(b) Type FR-SE AC spindle controller
(c) Spare fuse

AC spindle $\underset{\text { FR-SE }}{\text { controller }} \quad$ AC spindle motor

(2) Magnetic sensor system with single point orientation unit AC spindle controller $\quad$ AC spindle motor

(3) Encoder system with multiple point orientation unit

(4) Internal configuration of controller

| Configuration | Circuit board configuration |
| :--- | :---: |
| (a) Basic configuration | SE-PW, SE-101, SE-CPU1 or CPU2 |
| (b) Magnetic sensor system <br> With single point orienta- <br> tion unit | SE-PC; , SE-107, SE-CPU1 |
| (c) Encoder system <br> With multiple point orienta- <br> tion unit | SE-PU, SE-101, SE-CPU2 |

(1) Magnetic sensor type with single point orientation, unif

### 3.1 OPERATION PREPARATIONS

Check the following points when switching on the power to the controller for the first time:
(1) Check that all the equipments are properly wired and connected as shown in the drawings?
(2) Check that the motor and control panel are grounded properly?
(3) Check that the shield wire terminations are connected properly?

0 Make the proper connections to the shiled terminals.
0 Make the connections so that the shield areas do not form a loop.
(4) Check that the equipment is secured properly to avoid looseness and damage.
(5) Check that metal chips, pieces of wire and other foreign matter have not entered inside the equipment.
(6) - Check that there is nothing abnormal with the exteriors of the printed circuit boards.
(7) Check that the ROM numbers and DIP switch settings are as per the order parts list.

### 3.2 INCOMING POWER

If all items under section 3.1 are satisfactory, power up the equipment as follows:
(1) Switch on the incoming power.
(2) Check that light-emitting diodes LED12, 13, 14 and 15, which are designed to indicate trouble and which are located on the front of the controller, have nto lighted.
(3) Check that light-emitting diodes LED2 (READY) and LED10 (ZERO SPEED), which are designed to indicate the status and which are located on the front of the controller, have lighted.

These procedures enable operation.
No problems are posed with the controller and re-connection is not necessary even if the phase sequence of the incoming power is reversed. It is possible to check whether the phase sequence is positive or reversed by observing LED1 (PHASE SEQUENCE). A positive phase sequence is indicated when LED1 lights.
(1) Speed meter: (VR14), load meter: (VR15) When driving the speed meter with the spindle inverter: set the DIP switch SW6-6toOFF and then adjust VR14 so that the speed meter indicates the maximum speed. Adjust VR15 so that the load meter indicates $120 \%$. Upon completion of the adjustments, return SW6-6 to the ON position and set the reset (ST1) swtich to ON once. Under no circumstances should the VRs be touched unless absolutely necessary.
(2) Setting DIP switches, setting pins Re-check that the DIP switches and pins are set as in the order parts list in accordance with the machine. If they have not been set, change their settings. Set the reset (STI) switch to ON the settings have been changed. Adjust the orientation when changing the stop position in accordance with the machine. See section 3.5 for details.

### 3.4 RUNNING-IN OPERATION

Couple the motor and machine and then check the machine running-in and control state. Next, operate the motor under actual load conditions and check that there is no:

0 Abnormal noise
0 Abnormal smells

- Abnormal bearing temperature

### 3.5 ORIENTATION ADJUSTMENT PROCEDURES

Note: Setting DIP Switches and setting pins may vary slightly depending on the ROM No. and bar zone of the printed circuit board. check these on the order parts list.
(1) Magnetic sensor system

Operate at the creep speed (20 to 30 Ipm ) and VR2 is adjusted to the limit at which the magnetic sensor sensitivity LED 11 lights, then CH53 will be the peak voltage $\pm 10 \mathrm{~V}$.
The speed pattern for orientation is shown in the figure above.

In case of overshooting during stop:
o Increase the lst deceleration point range. (SW4-5,6,7)

- Increase the 2nd deceleration point range. (SW4-2,3,4)
o Reduce the orientation speed. (SW10 F $\rightarrow \mathrm{E} \rightarrow \ldots \rightarrow \mathrm{O}$ )
- Reduce the creep speed (SW4-1 OFF-ON)

Reduce the orientation time:
O Reduce the 1st deceleratió point range. (SW4-5,6,7)
0 Increase the orientation speed. (SW10 O-1-... $\rightarrow$ F)

- Reduce the 2nd deceleration point range. (SW4-2,3,4)

In case of hunting during stop:
O Increase the 2nd deceleration point range. (SW4-2,3,4)
o Reduce the magnetic sensor sensitivity. (VR2)
o Reduce the creep speed. (SW4-1 OFF $\rightarrow$ ON)
Furthermore, the stop position is adjusted with the VR1 position shift.

The speed pattern during orientation is shown in the figure above.

In case of overshoorting during stop:

- Increase the 1st deceleration point range. (SW4-5,6,7)
- Reduce the orientation speed (SW10 F $\rightarrow \mathbf{E} \rightarrow \ldots \rightarrow 0$ )
- Increase the 2 nd deceleration point'ranqe.
(SW4-2, 3, 4)
- Reduce the creep speed. (SW4-1 OFF $\rightarrow$ ON)

Reduce the orientation time:
O Reduce the 1st deceleration point range. (SW4-5,6,7)

- Increase the orientation speed. (SW10 $0 \rightarrow 1 \rightarrow \ldots \rightarrow$ F)
- Reduce the 2nd deceleration point range. (SW4-2,3,4)

In case of hunting during stop:

- Increase the 2 nd deceleration point range.
(SW4-2, 3, 4)
o Reduce the creep speed. (SW4-1OFF $\rightarrow$ ON)
Furthermore, the stop position is adjusted with the position shift SW13, 14 and 15.

## CHAPTER 4 REGULAR INSPECTIONS

Maintenance and inspection are indispensable in order for the equipment to do full justice to its performance, for breakdown to be prevented and for reliable operation to be assured over a long period of time.

## WARNING

Electric shocks can lead to death. Make sure that all power to the equipment is off before proceeding with the inspections.
4.1 CONTROLLER INSPECTIONS

| Inspection iter | Inspectio period | Checkpoints | Remedy |
| :---: | :---: | :---: | :---: |
| 1. Cooling fan | Honthly | 1. Try rotating by hand. Does it rotate smoothly? <br> 2. Try supplying power. Does it rotate effectively? <br> 3. Any abnormal noise from bearing sections? | そe- <br> olace <br> fan. |
| 2. Dirt, looseness | When appropriate ${ }^{f}$ | Clean parts regularly; tighten up input/output terminals and connections regularly. |  |
| 3. Small relay | $\begin{gathered} \text { Every } \\ 3 \\ \text { nonths } \end{gathered}$ | 1. Are contacts worn? <br> 2. Is main circuitry contactoi operating properly with operation of this relay? | Re- <br> place <br> relay, |
| 4. Wiring | When appropriate | Conductors must not touch case by wires being caught in hinge section. |  |

4.2 MOTOR INSPECTIONS

| Inspection item | $\begin{aligned} & \text { Inspect } \\ & \text { tion } \\ & \text { period } \end{aligned}$ | $\dagger$ Checkpoints | Remedy |
| :---: | :---: | :---: | :---: |
| 1 Noise | Monthly | Any noise or abnormal vibration not previously perceived? If present, check out the following: <br> 1 Check foundation, installation. <br> 2 Check centering accuracy of coupling. <br> 3 Vibration from coupled equipment?' <br> 4 Bearing damage or abnormal noise? <br> 5 Any vibration or noise in reduction gearor belt?, <br> 6 Trouble with controller? <br> 7 Trouble with cooling fan? <br> 8 Belt tension. |  |
| 2 Temperature rise | Monthly | Abnormal bearing temperature? <br> (Normally, ambient temperature of <br> +10 to 40 deg. $C$ ) <br> Motor frame temperature different from usual? If so, check points below: <br> 1 Is cooling fan rotating normally? <br> 2 Any foreign matter-in cooling path (between frame and cover) which is <br> - blocking path? <br> 3 Abnormally increased load? <br> 4 Trouble with controller? | Clean. <br> Refer <br> to <br> trouble- <br> shooting |

| 3 Insula- <br> tibn <br> resis- <br> tance | Every <br> 6 months | Abnormally low insulation resistance? <br> Isolate connections to control <br> panel and use megger to measure across circuitry and ground. <br> (No problem if 1 megaohm or more when measured with 500V megger.) <br> If less than 1 Megaohm, inside of motor must be cleaned and dried. Disassemble motor and dry in an oven at a temperature not exceeding 90 deg.C. |
| :---: | :---: | :---: |
| 4 Cooling fan | Every week Every month | Is fan-rotating and cooling properly? Any abnormal noise or vibration present? |

All the adjustments on the control cards have been made prior to shipment to the machine builders. Avoid, therefore, rotating the controls (VRs).
5.1 SE-CPU1 CARD

This card is used when
the magnetic sensor
orientation function
is provided.

(1) List of LEDs

| LED | Name | Application | Description |
| :---: | :---: | :---: | :---: |
| LED1 | PHASE <br> SEQUENCE | Power supply <br> phase identi- <br> fication | Lights when power supply phase rotation is positive. <br> OFF when power supply phase rotation is negative. |
| LED2 | READY | Ready | Lights when controller is ready to operate; OFF when SETI-SET2 inputs are OFF or when alarm occurs. |
| LED 3 | CW DRIVE | Motor forward (CW) rotation =ommand | Lights when forward rotation command has been input; also, lights with orientation stop. |
| LED 4 | CCW DRIVE | Yotor reverse <br> (CCW) rota- <br> tion command | Lights when reverse rotation signal has been input. |
| LED5 | SPEED DETECTION | Speed detection | Lights 'when motor speed falls below DIP switch setting. |
| LED 6 | ZURRENT <br> DETEC- <br> TION | Eurrent detection | Lights when a current equivalent to $110 \%$ of rated current flows to motor. |
| LED7 | UP TO SPEED | Speed arrival | Lights when actual motor speed is +/- 15\% of command speed. |
| LED8 | APPROACH | Approach | Lights during period from 1st to 2nd deceleration point. |

| LED | Name | Application | Description |
| :---: | :---: | :---: | :---: |
| LED 9 | $\mathrm{I} \quad \mathrm{~N}-$ POSITION | In-position | Lights with orientation stop within angle range set by DIP switch. |
| LED10 | ZERO <br> SPEED | Zero | Lights when speed is below zero speed set by DIP switch. |
| LED11 | SENS | Magnetic <br> sensor <br> sensitivity | Lights when magnetic sensor output during orientation is 8.5 V or more. |
| LED12 | - | - | Not used. |

(2) List of DIP switches and rotary switches

Note 1: "O" denotes DIP switch ON setting.
"X" denotes DIP switch OFF setting.
Note 2: The settings may differ slightly depending on the ROM used and so reference should be made to the order parts list.

Note 3: Make the setting marked with an asterisk apply from ROM 490-D or following.

Note 4: Make the settings marked with a double asterisk apply from ROM 490-C or following.

| Switch | Name | Description |
| :---: | :---: | :---: |
| SW1 | Gear ratio <br> (: H range) | ```Used to set gear ratio. Gear ratio = M Maximum apindle speed ``` Setting example: |
| SW2 | Gear ratio <br> (M range) | When max. spindle speed is 5000 rpm with a maximum H gear motor speed of 6000 rpm Hexa- <br> decimal |
| SW3 | Gear ratio <br> (L range) | Gear. ratio $=5000 / 6000 \times 128^{D}=106^{D}=6 A^{H}$ <br> This is treated as-the values below when the following switches are all ON. <br> SW1 all switches ON ... Gear ratio $=80^{\mathrm{H}}$ <br> SW2 all switches ON $\ldots$ Gear ratio $=40^{\mathrm{H}}$ <br> SW3 all switches ON <br> ... Gear ratio $=20^{\mathrm{H}}$ |

| Switch | Name | Description |
| :---: | :---: | :---: |
| SW4-1 | Creep speed | Used to set creep speed with orientation. |
| $\begin{aligned} & \text { SW4-2 } \\ & \sim 4 \end{aligned}$ | 2nd deceleration point range | Used to set the 2 nd deceleration point range. <br> 2nd deceleration point range $\ldots 25 \text { deg. }$ <br> ... 24 deg. <br> ... 23 deg. <br> ... 21 deg. <br> ... 20 deg. <br> ... 19 deg. <br> ... 18 deg. <br> ... 16 deg. |
| $\begin{gathered} \text { SW4-5 } \\ \sim 7 \end{gathered}$ | 1st deceleration point range | Used to set the 1st deceleration point range. |

| Switch | Name | Description |
| :---: | :---: | :---: |
|  | - | 5 6 7 <br> 0 0 0 <br> 0 0 $x$ <br> 0 $x$ 0 <br> 0 $x$ $x$ <br> $x$ 0 0 <br> $x$ 0 $x$ <br> $\mathbf{x}$ $\mathbf{x}$ 0 <br> $\mathbf{x}$ $\mathbf{x}$ $\mathbf{x}$ <br> 1st deceleration point range <br> ... 212 deg. <br> ... 203 deg. <br> ... 194 deg . <br> ... 185 deg . <br> ... 176 deg. <br> ... 167 deg . <br> ... 158 deg . <br> . $\therefore 149 \mathrm{deg}$. |
| SW4-8 | Magnetic senmounting direction | $\mathbf{8}$ . Set to reverse position if <br>  ..Forward high degree of hunting oc- <br>  . . Reverse curs with orientation stop. |
| $\begin{gathered} \text { SWS- } \\ 1,2 \end{gathered}$ | Torque limit | Used when limiting motor torque. <br> (Note) 30-minute rated torque is $100 \%$. |

| Switch | Name | Description |  |  |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| SW5-3 $\sim 5 * *$ |  |  |  |  |  |  |  |  |  |  |
| SW5-6 $\sim 8$ |  | Output transistors are activated when the speed is whithin the set motor speed range. <br> Speed detection range <br> ... . $2 \%$ or below <br> ... 10\% " <br> ... 18\% " (Note) <br> ... $26 \%$ Maximum speed <br> ... $34 \%$ " is $100 \%$. <br> ... $42 \%$ <br> ... $50 \%$ <br> ... 58\% " |  |  |  |  |  |  |  |  |

| Switch | Name | Description |
| :---: | :---: | :---: |
| SW6-1 | Normal/test $\text { of } f$ | 1 <br> ...Normal mode <br> $\mathbf{x}$... Test mode <br> Normal mode is used for normal operation. <br> Test position is used for orientation tests. |
| -2 | Closed/open | Used for switching between open/closed speed loop. <br> ... Closed loop <br> ... Open loop <br> Used with closed loop for normal operation. Speed detector go/no go, etc. can be . identified in the open and closed. operation states. |
| SW6-3 | Binary/BCD | ... Speed command binary <br> ... Speed command BCD <br> Used to select digital speed command format. <br> Speed command is read as binary 12-bit input for binary and as BCD 2-digit input for BCD. |
| -4 | Speed input emitter/ collector | ... Speed input open emitter <br> ... Speed input open collector <br> (Note) Refer to the settings of P59 IO1 card pins 2 and 3. |

| Switch | Name | Description |
| :---: | :---: | :---: |
| - sw6-5 | Servo <br> rigidity <br> selection |  |
| -6 | Meter calibration | ... Meter OFF <br> ... Meter ON <br> Used to calibrate speed meter and load meter full scale. In ON mode, the meter full scale voltage is output and so adjust speed meter (SM1, VR14 SE-IO1 card) and load meter (IM1, VR-15 SE-101 card) VRs. |
| SW6-7 | Maximum speed | ... Maximum speed LOW <br> $\mathbf{x}$... Maximum speed HIGH <br> Used to switch the maximum speed (3450/4600, 4500/6000, 6000/10000 rpm) in accordance with the motor type setting. |

| Switch | Name | Description |
| :---: | :---: | :---: |
| SW6-8 | Zero speed | - ... zero speed LOW ( 25 rpm ) <br> x ... Zero speed HIGH ( 50 rpm) <br> Zero speed is output at zero speed setting or below. |

(3) List of pushbutton switches

| No. | Name | Description |
| :--- | :--- | :--- |
| ST1 | Reset | Press the ST1 switch when the inverter operation <br> is to be initialized totally and when the DIP <br> switches and other settings have been reset. <br> Do not set the switch while the motor is opera- <br> ing. If it is reset while the motor is operating, <br> the motor free-runs and then stops. |
| ST2 | Orienta- <br> tion <br> test | Motor operates at orient. speed while this switch <br> is on. When OFF, orient. is performed once and <br> then motor stop. <br> (Note) This is effective only when sw6-1 is OFF. |

(4) List of variable resistors

| VR | Name | Description |
| :---: | :--- | :--- |
| VR1 | Position <br> shift | This enables the stop position to be finely <br> adjusted. |
| $\mathbf{V R 2}$ | Magnetic <br> sensor <br> sensitivity | This is adjusted so that the magnetic sensor <br> sensitivity display LED11 lights during opera- <br> tion the creep speed (20-30 rpm). |

(5) List of check pins

| No. | Description |
| :--- | :--- |
| P5A | $\mathbf{+ 5}$ |
| DGA | $\mathbf{+ O V}$ (digital ground) |
| CH50 | Speed feedback, phase $A$, square wave |
| CH51 | -15V |
| CH52 | $+\mathbf{1 5 V}$ |
| CH53 | Magnetic sensor output |
| CH54 | +0V (analog ground) |
| CH55 | +15V |
| CH56 | A/D converter input |
| CH57 | Speed feedback, phase $B$, sinusoidal wave |
| CH58 | Speed feedback, phase $\bar{B}$, sinus'oidal wave |
| CH59 | Speed feedback, phase $\bar{A}$, sinusoidal wave |
| CH60 | Speed feedback, phase $A$, sinusoidal wave |
| CH61 | Speed feedback, phase $B$, square wave |
| CH62 | +24V |

5.2 SE-CPU2 CARD

This card is used when the $1024 \mathrm{P} /$ rev 2 phase encoder type of multiple point orientation function is provided.

(1) List of LEDs

| LED | Name | Application | Description |
| :--- | :--- | :--- | :--- |
| LED1 | PHASE | Power supply |  |
| phase identi- |  |  |  |
| fication | Lights when power supply phase ro- |  |  |
| tation is positive. |  |  |  |
| OFF when power supply phase rota- |  |  |  |
| tion is negative. |  |  |  |

| LED10 | ZERO | Zero | Lights when speed is below zero |
| :--- | :--- | :--- | :--- |
|  | SPEED | speed | speed set by DIP switch. |
| LED11 | - | - | Not used |
| LED12 | - | - | Not used. |

(2) List of DIP switches and rotary switches

Note 1: "0" denotes DIP switch ON setting.
"X" denotes DIP switch OFF setting.

Note 2: The settings may differ slightly depending on the ROM used and so reference should be made to the order parts list.

Note 3: Make the settings marked with an asterisk apply from ROM 480-E or following.

Note 4: Make the settings marked with a double asterisk apply from ROM 480-F or following.

| Switch | Name | Description |
| :---: | :---: | :---: |
| SW1 | Gear ratio <br> (H range) | Used to set gear ratio. $\begin{aligned} & \text { Gear ratio }=\frac{\text { Maximum spindle speed }}{\text { Maximum motor speed }} \times 80 \mathrm{H} \\ &\left(=128^{\circ}\right) \end{aligned}$ <br> Setting example: |
| SW2 | Gear ratio <br> (M range) | When max. spindle speed is 5000 rpm with a maximum Hgear motor speed of 6000 rpm Hexadecimal |
| SW3 | Gear ratio <br> (L range) | This is treated as the values below when the following switches are all ON. <br> SW1 all switches ON ... Gear ratio $=80^{\mathrm{H}}$ <br> SW2 all switches ON...Gear ratio $=40^{\text {H }}$ <br> SW3 all switches ON . . . Gear ratio $=20^{\mathrm{H}}$ |

| Switch | Name | Description |
| :---: | :---: | :---: |
| SW4-1 | Creep speed | Used to set creep speed with orientation. <br> Creep speed <br> ... 20 rpm ... 30 rpm |
| $\begin{aligned} & \text { SW4-2 } \\ & \sim 4 \end{aligned}$ | 2nd deceleration point range | Used to set the 2nd deceleration point range. <br> 2nd deceleration point range <br> ... 25 deg. <br> ... 24 deg. <br> ... 23 deg. <br> ... 21 deg. <br> ... 20 deg . <br> ... 18 deg . <br> ... 17 deg. <br> ... 15 deg. |
| $\begin{gathered} \text { SW4-5 } \\ \sim 7 \end{gathered}$ | 1st decele- <br> ration point <br> range | Used to set the lst deceleration point range. <br> 1st deceleration point range <br> ... 225 deg. <br> ... 214 deg . <br> ... 203 deg. <br> ... 191 deg. <br> ... 180 deg. <br> ... 169 deg. <br> ... 158 deg. <br> ... 146 deg . |

| Switch | Name | Description |
| :---: | :---: | :---: |
| SW4-8 | Encoder <br> mounting <br> direction | Set to reverse position if <br> ..Forward high degree of hunting oc- <br> . . Reverse curs with orientation stop. |
| $\begin{gathered} \text { SWS- } \\ 1,2 \end{gathered}$ | Torque limit | Used when limiting motor torque, |

| Switch | Name | Description |
| :---: | :---: | :---: |
| SW6-1 | Normal/test | 1 <br> $\odot$ <br> ... Normal mode <br> ...Test mode <br> Normal mode is used for normal operation. <br> Test position is used for orientation tests. |
| -2 | Closed/ope | ... Closed loop <br> x ... Open loop <br> Used for switching between open/closed speed loop. Used with closed loop for normal operation. <br> Speed detector go/no go, etc. can be identified in the open and closed operation states. |
| SW6-3 | Binary/BCD | ... Speed command binary <br> ... Speed command BCD <br> Used to select digital speed command format. Speed command is read as binary 12 -bit input for binary and as BCD 2-digit input for $\operatorname{BCD}$. |

| Switch | Name | Description |
| :---: | :---: | :---: |
| SW6-4 | Speed input <br> emitter/ <br> collector | ... Speed input open emitter <br> . . Speed input open collector <br> (Note) Refer to the settings of P59 101 card pins 2 and 3. |
| -5 | Position input emitter/ collector | ... Position input open emitter <br> ... Position input open collector <br> (No.te) Refer to the settings of P59 101 card pins 2 and 3. |
| -6 | Meter <br> calibration | - ... Meter OFF <br> $x$... Meter ON <br> Used to calibrate speed meter and load meter full scale. In $O N$ mode, the meter full scale voltage is output and so adjust speed meter (SM1, VR14 SE-101 card) and load meter (LMI, VR-15 SE-101 card) VRs. |

| Switch | Name | Description |
| :---: | :---: | :---: |
| SW6-7 | Maximum speed | 0 ... Maximum speed LOW <br> x $\quad$... Maximum speed HIGH <br> Used to switch the maximum speed (3450/4600, 4500/6000, 6000/10000 rpm) in accordance with the motor type setting. |
| -8 | Zero speed | Zero speed LOW (25 rpm) <br> ... zero speed HIGH (50 rpm) <br> Zero speed is output at zero speed setting or below. |
| SW7-1 | Servo <br> rigidity <br> selection | 1 <br> 0 <br> $\mathbf{x}$ <br> ... Servo rigidity HIGI <br> ... Servo rigidity LOW |
| -2 | External <br> emergency <br> stop | - . . . LED ON with emergency stop <br> $\boldsymbol{x}$. . LED OFF with emergency stop <br> Used to select mode with alarm display or mode without alarm display in external emergency stop. |

| Switch | Name | Description |
| :---: | :---: | :---: |
| SW7-3 | Load meter output | .. Load meter output HIGH (10V) <br> Load meter output LOW (3V) <br> Used to select output voltage with 120\% output. |
| -4 | Base speed | 4 <br> O. ... 1150 rpm base speed <br> x $\quad 1500$ rpm base speed <br> Used to select base speed of applicable motor. |
| $\begin{aligned} & \text { SW7-5 } \\ & -8 \end{aligned}$ | Motor type <br> Select the selection speed (SW7-4) |  <br> ompatible motor in combination with the the maximum speed (SW6-7) and of the base |

| Switch | Name | Description |  |

## (5) List of VRs

| No. | Description |
| :---: | :---: |
| VR1 | Phase W, current command zero adjustment |
| VR2 | Phase V, current command zero adjustment |
| VR3 | Phase U, current command zero adjustment |
| VR5 | +/-10V, reference power supply (Note 1) |
| VR6 | Over-speed level adjustment, corresponding to PINI-A (Not |
| VR7 | Over-speed level adjustment,' corresponding to PIN1-B (Not |
| VR8 | Converter voltage gain adjustment, . |
| VR9 | Supply voltage beak value gain adjustment |
| VR10 | Regenerative converter current zero adjustment, CH43A |
| VR11 | Converter DC current zero adjustment, CH58 |
| VR12 | Inverter side, phase V, current feedback zero adjustment, CH57 |
| VR13 | Inverter side, phase $U$, current feedback zero adjustment, CH56 |
| VR14 | Speed meter adjustment |
| VR15 | Load meter adjustment |

Note 1: Starting with edition G54, VR5 and VR7 have been discontinued on the IO1 card.

Note 2: Over-speed is adjusted by VR6 and PIN1-A and B.
5.4 SE-PW

This is the power supply which supplies all the FR-SE DC power.

AC 170-253V input

## Notes:

- (1) Notethatexcept for block A no insulation is provided with the main circuitry..
(2) Line 0 in block A is connected.

| Block | Name | Groun |  | DC output voltage |

| J | AC DOWN signal |  |  |  | 6.1 MAGNETIC SENSOR TYPE OF SINGLE POINT ORIENTATION

```
(SE-CPU1 card is used)
```

6.1.1 MAGNET AND SENSOR OPERATION .

Depending on the position relationship with the magnet, the sensor generates two kinds of voltages (see Fig. 6.1).

Fig. 6.1 Sensor output voltages

## MS signal

This is characterized by the fact that its output voltage is OV at the center position of the magnet and that it reaches a peak at both ends of the magnet. It is controlled so that the OV voltage position is always the home position.

LS signal
This is characterized by the fact that it is a constant voltage within the area of the magnet. Itis employed for checking that stopping has without fail occurred within the magnet area.

### 6.1.2 TIME CHART

Fig. 6.2 is a time chart of the various signals.

Fig.6.2 Time chart
(1) When the ORC1 (orientation signal) is set ON, the motor speed is switched over from the normal operation speed to the orientation speed.
(2) When the motor speed arrives at'the orientation speed, the speed arrival signal rises.
(3) After the speed arrival signal has risen, the software slowdown timer starts operating at the timing (at the very time the magnet passes in front of the sensor) during which the sensor $L S$ signal falls.
(4) The slowdown timer is set by SW4-5,6,7. When the timer counts up, a switch is made from the orientation speed to the creep speed. (1st deceleration point)
(5) At the creep speed, a switch is made to the position loop by the timing at which the LS signal has risen to the high "level. (2nd dece'leration point)
(6) The sensor MS signal stops at the OV position due to the position loop control.
(7) The orientation finish signal rises at the target position and ORA1-ORA2 are set to closed.

### 6.1.3 MAGNET AND DETECTION HEAD MOUNTING DIRECTIONS

The mounting directions for the magnet and detection head are specified as shown in Figs. 6.3, 4 and 5.
(1) Mount so that the index hole in the center of the magnet and the key slot on the-detection head are positioned on the same side.
(2) Mount the index hole on the right side (on the opposite side to that of the tool) when the spindle tool is on the left side.

Case 1 Mounting the magnet onto the circumference of a rotating body

As shown in Fig. 6.3, mount so that the key slot and index hole point to the non-load side of the spindle.

Fig. 6.3 Mounting onto the circumference of a rotating body

Case 2 Mounting the magnetontothe flat surface of a rotating body
(1) When the mounting surface is on the non-load side of the spindle, mount so that the index hole and key groove are pointing toward the center side, as shown in Fig. 6.4.
(2) When the mounting surface is on the spindle load side, mount so that the index hole and key groove are on the circumference side, as ahown in Fig. 6.5.

Fig. 6.4 Mounting onto a flat surface oh the non-load side of the rotating body

Fig. 6.5 Mounting onto aflat surface on the load side of the rotating body

## Notes

(1) Orientation will remain normal even if the magnet and detector are mounted, as shown in Fig. 6.6, in the opposite way to that shown in Figs. 6.3, 4 and 5.
(2) Unless the directions in which the magnet and detector point tally, as shown in Fig. 6.7, a high level of vibration results at both ends ofthemagnet and orientation is disabled.

Fig. 6.6

Fig. 6.7

### 6.1.4 CHECKPOINTS WHEN MOUNTING MAGNET

Bear in mind the following points when mounting the magnet onto the spindle.
(1) Do not bring strong magnetic objects near the magnet.
(2) Take care not to subject the magnet to shocks.
(3) Use M4 screws to secure the magnet rigidly to the spindle.
(4) Provide the rotational balance of the whole spindle with the magnet mounted.
(5) Bring the index hole in the center of the magnet to the center of the mounting disc and align its direction with that shown in Figs. 6.3, 4 and 5.
(6) Make sure that the surroundings are clean so that metal chips and dustdo not adheretothe magnet and thereby cause errors.
(7) Paint over the mounting screws to lock them in position so as to avoid any looseness.
(8) When the magnet is to be mounted onto a polished disc, the disc may have become magnetized. Steps should therefore be taken to demagnetize it.
(9) The diameter of the disc onto which the magnet is mounted should be not less than 80 mm and not more than 120 mm . It may be-larger if the spindle speed is low.
(10) When the spindle onto which the magnet is mounted rotates at a speed higher than $6,000 \mathrm{rpm}$, the magnetmustbe replaced with a high-speed version (which can be used up to 10,000 rpm) .

### 6.1.5 CHECKPOINTS WHEN MOUNTING SENSOR

Bear in mind the following points when mounting the sensor.
(1) Ensure that the key slot on the detection head and the index hole in the magnet are pointing in the same direction.
(2) Mount the sensor so that the center line on the end of the head and the center of the magnet are aligned (see Figs. 63, 4 and 5).
(3) Refer to Table 1 for the size of the gap between the magnet and detector when thr mounting method in Fig. 6.3 is adopted. Refer to Table 2 when the methods in Fig. 6.4 or 6.5 is employed.

* It is recommended that jigs be made for mass production.
(4) Although the pre-amplifier connector is oil-proof, it should be mounted where the chances for oil to come into contact with it are minimal.
(5) Lay the cable to the controller from the pre-amplifier at a distance from the power supply circuitry wires so that it is isolated from them.
(6) First check the connector connections and ensure that the connectors have been inserted properly into the receptacles, and then tighten up their lock screws.

Table 1

### 3.1 Magnetic sensor

(1) Magnet

(2) Detection head

(3) Amplifier

Fig. 6.9
6.2 ENCODER TYPE OF MULTIPLE POINT ORIENTATION(SE-CPU2 card is used)

### 6.2.1 DESCRIPTION OF OPERATION

Operation is shown below in the form of a time chart.

Fig. 6.10 Time chart
(1) The orientation position is read in with the orientation command and the motor speed is switched to the orientation speed.
(2) When the motor speed arrives at the orientation speed, the speed arrival signal rises.
(3) When the mark pulse is input from the encoder after the speed arrival signal has risen, the orientation position count given in 12-bit binary code from the external source starts.
(4) When the value (lst deceleration point) set by SW4-5, 6 and 7 from the target point is reached, the motor speed switches from the orientation speed to the creep speed.
(5) A switch, is made to the position loop at the value (2nd deceleration point) set by SW4-2, 3 and 4 from the target point, the motor starts decelerating and it stops at the target point.
(6) The IN-POSITION signal rises before the target point by an amount equivalent to the SW12 setting value and then the IN-POSITION signal output contact closes.
(7) When the orientation command is released, the motor is reset to the speed of the speed command given at that time.
(8) When re-orientationing from the orientation mode, the spindle rotates once and orientation is performed,. Depending on the settings of SW13, SW14 and SW15 for position adjustment and on the orientation position given externally, the spindle will rotate more than once.

Fig. 6.11

Note: When the motor rotation direction and encoder rotation direction differ, make the adjustment using DIP switch SW4--8 on SE-CPU2.

### 6.2.3 ENCODER DIMENSIONS

Fig. 6.12

## 7. 1 INTRODUCTION

When trouble occurs in the controller, check out the following points as far as possible. Then proceed with inspection and repair work as outlined in the sections below. The following points are extremely useful when making contact with servicing personnel and explaining what has happened. Checkpoints when trouble occurs
(1) Have trouble lamps on controller's cosmetic panel lighted? Which lamps have lighted?
(2) If a fuse has blown, is it the $R$, $S$ or $T$ phase? ((Control circuit input fuses)
(3) Does the trouble or failure recur?
(4) Are the ambient temperature and temperature inside the panel at the regular levels?
(5) Does the trouble occur during acceleration, deceleration or during constant speed operation? What is the speed at the time of the trouble?
(6) Is there any difference with forward and reverse rotation?
(7) Was there a momentary power failure?
(8) Does the trouble ocur with a specific. operation or command?
(9) What is the frequency with which the trouble occurs?
(10) Does the trouble occur with a load added or reduced?
(11) Have parts been replaced or any other stopgap measures taken?
(12) How many years have passed since the equipment was first operated?
(13) Is the supply voltage normal? Does it vary'greatly depending on the time zone.

## 7.2 'STEP 1

Check the following points as the first step in troubleshooting.
(1) Supply voltage:
$2 \mathrm{oov}+/-10 ;, \quad 50 / 60 \mathrm{~Hz}, 210 / 220 / 230 \mathrm{~V}+/-10 \%, 60 \mathrm{~Hz}$
The power supply should not be allowed to fall below 200 V -101 even for short periods of time.

Examples: Voltage drops at certain times every day.
Voltage drops when certain machines are started.
(2) Is anything wrong with the control functions around the controller?

Examples: Anything-wrong with NC, sequence circuitry?
Visually inspect parts, connections for trouble.
(3) Is the temperature around the controller (temperature inside panel) less than 55 deg.C.
(4) Anything wrong with exterior of controller?

Examples: Card parts, pattern burnouts, trouble, etc.
Loose connections, damage, foreign matter.
(5) Do all the SE-PW DC power outputs correspond with the prescribed voltages?

Once the above checks have been carried out, it should be possible to determine which parts are th.e cause of the trouble and to identify what the trouble is. Trouble in the FR-SE series can be broadly divided as follows:

Trouble group A
0 Power is supplied to the controller for the first time but it does not operate properly (I)
o The controller has been operating properly to date but has suddenly ceased to do so (II)

0 The controller does not operate properly from time to time, the orientation stop position shifts and the fault lamp lights (III). Trouble group B

- Trouble in the controller
- Trouble in main circuitry

0 Trouble in control circuitry
0 Trouble in the detector

- Trouble in encoder for speed detection
o Trouble in encoder for multiple point orientation
o Trouble in magnetic sensor for single point orientation
0 Trouble in power supplies
0 Trouble in motor.
0 Other trouble (inadequate input signal conditions, cable disconnection, etc.) •
7.3 STEP 2

| Trouble grour | Checkpoints | Remedy |
| :---: | :---: | :---: |
| Power is supplied to controller for first time bu it does not operate properly. | Stringent tests were conducted when unit was shipped but if unit does not operate properly when power is turned on for first time, cause may be: <br> 1 Controller sustained a heavy blow during operation or installation and was damaged. | Visually inspect exterior of unit for signs of trouble. |
|  | 2 External wiring or se quence error, disconnection. $\qquad$ <br> Power supply phase sequence is unrelated. | 2Check that power LEDs inside SE-PW light. Check that nothing is wrong with external wiring and sequence. (Note 1) |
|  | 3 Check again that ROM numbers and DIP switch settings are identical to those on order part: list. | If they differ,.replace ROM or reset. |
|  | Motor speed does not increase. | Change over any 2 of $U$, <br> V, W phases of motor |

|  |  | armature wiring. |
| :---: | :---: | :---: |
|  | 5 OK if only motor operates. | 5 Re-check that load corresponds to design value. |
|  | 6 Irregular operation with orientation stop. only. (overshoot, etc.) | 6 Re -adjustment required. |
|  | 7 Controller fault LEDs light: AL8, AL4, AL2, AL1 (LED12) (LED13) (LED14) (LED15) | fer to Section 7.4. |

Note 1: The start signal CW and CCW inputs must be set ONafter the READY signal and speed command have been supplied.

| Trouble ${ }_{\text {II }}$ group | Checkpoints | Remedy |
| :---: | :---: | :---: |
| Controller has been operating properly to datt but has suddenly ceased to do so. | 1 Check for blown fuses, main' circuitry no-fuse breaker tripping. | I Replace any blown. fuses; if fuse blows even after replacement, check under step 3. |
|  | 2 Check input power. $\begin{aligned} & \mathrm{AC} 200 \mathrm{~V}+/-10 \%, 50 / 60 \mathrm{~Hz} \\ & \mathrm{AC} 200-230 \mathrm{~V}+/-10 \%, 60 \mathrm{H} \end{aligned}$ | ? Reset to normal value if incorrect. Make available power supply so that voltage on left is maintained even in transient state. |
|  | 3 Controller fault LEDS light: AL8, AL4, AL2, AL1 (LED12) (LED13) (LED14) <br> (LED15) | Refer to Section 7.4. |
|  | 4 Input signal from NC or sequencer OK? <br> LED2 (READY) lights in ready state; LED3 (CW) lights with forward ro. tation; LED4 (CCW) lights with reverse ro tation. | \| Restore external input to normal. |
|  |  | i If operation possible, trouble lies |

| Trouble group | Check points | Remedy |
| :---: | :---: | :---: |
|  | Check whether open operation is possible with SW6-2 OFF (open), SWS-3, 4 and 50FF and reset PB ON. | ```in speed feedback encoder. Try re- placing encoder. If operation is still disabled, trouble lies in main circuitry: Fault display LED will lights.``` |

| Trouble group III | Check points | Remedy |
| :---: | :---: | :---: |
| Controller does not operate properly from time to time. <br> Orientation stop position shifts. Fault display LED lights. Switching on power or resetting after power has been switched off results in resetting and normal operation. | :In this case, whole ssituation must be clearly grasped. (Load situation, operation mode) <br> Cause may be (3) below. |  |
|  | 1 Input power is suddencut off or reduced, undervoltage LED or LED17 lights. | Check fluctuations in input power and other details. |
|  | 2 Control circuitry malfunctions with abnormally high noise levels. The controller can withstand $1600 \mathrm{~V} / 1 \mu \mathrm{~s}$ power line noise. | Locate source of noise, and mount surge kiiler at source. <br> Ground (particularly, detector) connection method. Re-check. |
|  | 3 Is load overloaded momentarily under effect of vibration, 'etc.? <br> Check thoroughly with orientation errors, etc. | Check out machine system. <br> Check backlash with spindle encoder and spindle. |

### 7.4 SYMPTOMS AND REMEDIES

1. When the fault display LEDs light

The trouble code activated the fastest indicates the trouble. (1 signifies "ON" or lights and 0 "OFF" or goes out.)
(1) MOTOR OVER HEAT

| AL8 | (LED 12) | AL4 | (LED13) | AL2 | (LED14) | AL1 (LED15) |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| 0 | 0 | 0 | 1 |  |  |  |

OHS1 and OHS2 are not activated.

| Trouble | Checkpoints | Remedy |
| :--- | :--- | :--- |
| Overloading | 1 Motor load <br> 2 Start/stop frequency | 2 Reduce load. <br> Fan failure |
|  | Is fan motor working <br> properly? | Repair or replace fan. |
| Blocked motor <br> air intake | Sufficient air passing <br> through? | Clean. |
| Temperature <br> detection <br> element <br> failure | Reset after motor fan is <br> operated for several <br> minutes in motor stop <br> state? | Shortcircuit oHS1-OHS2 <br> as stopgap measure and |

(2) EXCESSIVE SPEED ERROR

| AL8 (LED12) | AL4 LED1 3) | AL2 (LED14) | AL1 (LED15) |
| :---: | :---: | :---: | :---: |
| 0 | 0 | 1 | 0 |

When an error (500 rpm) greater than prescribed between
command speed and present speed occurs for 12 seconds

| Trouble | Checkpoints | Remedy |
| :--- | :--- | :--- |
| Overloading | Motor load | Reduce load. |
| Speed detec- | Is open operation <br> possible? | Replace-encoder. |

| tion encoder <br> trouble | sible |  |
| :--- | :--- | :--- |
| Card <br> trouble | SE-CPU1 or SE-101 card <br> trouble | Replacement sequence: <br> CPU $1,2 \rightarrow 101$ |

(3) BREAKER TRIP

| AL8 (LED12) | AL4 LED13) | AL2 | (LED14) | AL1 | (LED15) |
| :---: | :---: | :---: | :---: | :---: | :---: |
| 0 | 1 | 0 | 0 |  |  |

Lights when main input NFB is tripped.
IOC (converter/inverter) LED may light first.

| Trouble | Checkpoints | Remedy |
| :--- | :--- | :--- |
| Supply volt- | Check that supply volt- | When voltage is near 180V |
| or less 180V | age during deceleration | in normal mode, it may |
| (regeneration) does not |  |  |
| fall below prescribed |  |  |
| value. . . | fall below this value in <br> transient mode and so it <br> should be increased. Or <br> increase power supply <br> capacity. |  |
| Refer to IOC  <br> trip. Refer to IOC trip. | Refer to IOC trip. |  |

(4) PHASE LOSS

| $A L 8$ | (LED12) | AL4 | LED1 3) | AL2 |
| :---: | :---: | :---: | :---: | :---: |
| (LED14) | AL1 (LED1 5) |  |  |  |
| 0 | 1 | 0 | 0 |  |

This is checked and lights up only when power is ON.

| Trouble | Checkpoints | Remedy |
| :--- | :--- | :--- |
| Phase loss | Check voltage of input | Return 3-phase power sup- |
| phases. | ply to normal. |  |
| Blown fuse F1, Check cause, inspect for <br> 2,3 Rhortcircuiting. | is wrong. |  |

(5) EXTERNAL EMERGENCY

| AL8 (LED12) | AL4 (LED13) | AL2 (LED14) | AL1 (LED15) |
| :---: | :---: | :---: | :---: |
| 0 | 1 | 1 , | 0 |

When SW7-2 is ON
This lights when the external emergency stop input (normally ON) is cut off. Inspect thoroughly for causes and then set input to ON. Return to normal operation.

When SW7-2 is OFF
External emergency stop lamp does not light.
(6) OVER SPEED

| ALy | (LED12) | AL4 | (LED13) | AL2 | (LED14) |
| :---: | :---: | :---: | :---: | :---: | :---: |
| 0 | 1 | 1 | (LL1 | (LED15) |  |
| 0 | 1 | 1 |  |  |  |

This lights when the motor speed reaches $115 \%$ of the maximum speed and the over-speed detector circuit is activated.

| crouble | Checkpoints | Remedy |
| :---: | :---: | :---: |
| Incorrect max. speed setting | Check SE-101 PIN1 settings and SE-CPU SW7-4~ 8/SW6-7 settings. | Reset if incorrect. |
| Speed detector <br> trouble | Check encoder output frequency: <br> CH59, CH62 on CPU2 card CH60, CH57 on CPU1 card | $\begin{aligned} & \text { Replace detector. } \\ & \frac{256 \times 1500}{60} \text { at } 1500 \mathrm{rmm} \\ & =6.4 \mathrm{kHz} \end{aligned}$ |
| Speed detector command .circuit trouble | Defective card | Replacement sequence: <br> CPU1, $2 \rightarrow 101$ |

(7) IOC TRIP (INVERTER, CONVERTER)

| $A L 8$ | (LE DI) | $A L 4$ | (LE DI) | $A L 2$ | (LE DI) |
| :---: | :---: | :---: | :---: | :---: | :---: |

Inverter IOC

| ALB (LED12) | ALA (LED13) | ALP (LED14) | ALI (LED15) |
| :---: | :---: | :---: | :---: |
| 1 | 1 | 0 | 0 |

IOC tripping can occur at the inverter or converter side.
Overcurrent is denoted when either LED lights.
The main circuitry semiconductors may be damaged when the IOC fault recurs even after resetting.

| Trouble | Checkpoints | Remedy |
| :--- | :--- | :--- |
| Damage to <br> transistors | Disconnect connection between con- <br> troller and motor and operate con- <br> o If it lights, power transistors | Replace power <br> transistors. |
| are damaged. <br> o If it does not light, advance to <br> fold motor | Check motor load. |  |
| Faulty |  |  |
| motor |  |  |
| connections | Check wires around motor. Inspect <br> for looseness in terminal screws. | Correct wiring <br> if it has been |

| Trouble | Checkpoints | Remedy |
| :--- | :--- | :--- |
| Grounding <br> or shorting <br> of motor <br> winding | Measure with megger; motor is defec- | Replace motor. |
| Incorrect <br> power supply <br> capacity | Must be 180V or more even under load <br> conditions during acceleration/dece- <br> leration. | Increase power |

$$
j_{0}<1
$$

| Trouble | *Checkpoints | Remedy |
| :---: | :---: | :---: |
| Abnormal <br> supply <br> voltage <br> waveforms | Observe supply voltage waveforms with synchroscope and check that they are normal during acceleration and deceleration. <br> 1 When there is a partial drop <br> Must be less than $\mathbf{1 0 0 \mu s}$ <br> 2 When the peak value drops <br> Must be less than 2-3\% | Eliminate waveform distortior <br> 1 Increase capacity or increase power cable size. <br> 2 Improve other semiconductor unit in which waveform distortion occurs. |
| Ibnormal sower frequency | Must not change more than +/-3\% of prescribed frequency. | Improve frequency fluctuations. |
| Jefective zurrent de:ector cirzuit | Inverter CH3O-AGA <br> Trouble at 10 V peak <br> Converter CH43A-AGA <br> Trouble at 4.5 V peak. | Replace SE-101 card. |

(8.) CONTROLLER OVER HEAT

| AL8 (LED12) | AL4 LED13) $\mid$ AL2 (LED14) AL1 (LED15) |
| :--- | :--- | :--- | :--- | :--- | :--- |

| 1 | 0 | 0 | 1 |
| :---: | :---: | :---: | :---: |

Controller's thermal protector (mounted on cooling fan) is activated.

| Trouble | Checkpoints | (Remedy |
| :---: | :---: | :---: |
| Overloading | 1 Motor load <br> 2 Start/stop frequency | $\left\lvert\, \begin{array}{ll}1 & \text { Reduce load. } \\ 2 & \text { Reduce frequency. }\end{array}\right.$ |
| High ambient temperature | Measure controller's ambient temperature. | Consider cooling if it exceeds 55 deg.C. |
| Failure of fin cooling fan | Is fan working properly? | Replace fan. |

(9) UNDERVOLTAGE

| AL8 (LED13) | AL4 (LED14) | AL2 (LED15) | AL1 (LED16) |
| :---: | :---: | :---: | :---: | :---: |
| 1 | 0 | 1 | 0 |

LED lights when input power is 25ms, 170V-164vorless.

| Trouble | Checkpoints | Remedy |
| :---: | :---: | :---: |
| Usually, operation norm- <br> al; normal op- <br> eration with <br> resetting | Lights with speed change or under heavy load conditions. | Increase power capacity. |
| Lights usual$1 y$ | If input power is normal: <br> SE-PW trouble <br> ACDOWN-DO5A <br> High when control cir- <br> cuitry is normal (+5V) | Replace SE-PW. |

(10) OVERVOLTAGE (CONVERTER)

| ALB (LED12) | ALA (LED13) | ALP (LED14) | ALI (LED15) |
| :---: | :---: | :---: | :---: |
| 1 | 0 | 1 | 1 |

This LED lights when the voltage of the internal smoothing capacitor has risen above the allowable value.

| Trouble | Checkpoints | Remedy |
| :--- | :--- | :--- |
| High power imp- <br> edance |  | Increase power cap- <br> acity. |
| Momentary drop or <br> momentary power <br> failure during de- <br> celeration | Check if. LED 17 has come <br> on. | Reset and then <br> observe state. |
| Detector circuit <br> trouble | When above cases do not <br> apply, fault may lie in <br> detector circuit. | Replace SE-101 card. |

(11) Trouble in CPU

| ALP (LE D12) | ALA (LE DI) | ALP (LE DI) | AL 1 (LED15) |
| :---: | :---: | :---: | :---: |
| 1 | 1 | 0 | 1 |
| 1 | 1 | 1 | 1 |
| 1 | 1 | 1. | 1 |

This consists of errors in-the logic or in the operations A; Conneilinside the CPU cards. Observe the state after reset$9 / l$ Cableting. It may be necessary to replace the cards for the going CPU chips).
ont of When LED 12 through 15 on the $\sqrt{\text { IOI card do not light with }}$ $u_{1} i f$ resetting, the CPU card is faulty. Cards CPU1 and 2 must (o mag $\mathrm{Sol}{ }^{\circ}$ "be replaced.
01 encode
2. When the fault display lamps do not light
(1) The motor does not operate at all even though there is no fault display.

| Trouble | Checkpoints | Remedy |
| :---: | :---: | :---: |
| Incorrect con. <br> nections or <br> disconnection | Check wiring and inspect for disconnections. | Wire properly. |
| :Incorrect in:input voltage | $200 \mathrm{~V}, 50 \mathrm{~Hz} / 200-230 \mathrm{~V}, 60 \mathrm{~Hz}$ for all3 phases? | Return power supply to normal. |
| :Incorrect DC power | Check all output voltages of cards and SE-PW with multimeter. | Replace if defective. |
| Jefective cari | Set SW6-2 to OFF (normally ON), establish open mode and increase command speed. Are reference sine waves produced? <br> SE-101 card <br> CHS-AGA <br> CH4-AGA | If trouble is found: replace cards starting with SE-101 card finishing with SE-CPU card. |
| External emer. <br> gency stop or <br> reset signal <br> indut | Check if LED19 has lighted. | Check connections. |

(2) Motor operates only slowly even though there is no fault display.

| Trouble | Checkpoints | Remedy |
| :--- | :--- | :--- |
| Faulty motor | Is motor connected in proper | Re-connect pro- |

| connection | sequence to output terminals <br> $U, V$ and $W$ on controller? | perly. |
| :--- | :--- | :--- |
| Incorrect in- <br> put power | Is input power normal for all <br> 3 phases? | Return power to <br> normal. |
| Incorrect ex- <br> ternal speed <br> command | When speed command from ex- <br> ternal source is increased, <br> does motor speed increase in <br> proportion? | Reset external speed <br> command circuit. |
| Speed detec- <br> tion encoder <br> trouble | Is open operation possible <br> with SW6-2 oFF? | Replace encoder. |

(3) Motor operates at specific speed only and not as commanded.

| Trouble | Checkpoints | Remedy |
| :--- | :--- | :--- |
| Incorrect ex- | Does speed command from ex- | Reset external speed |
| ternal speed | ternal source change linear- | command circuit. |
| command | ly from OV to 1OV? (CH41-AGA) |  |

(4) Insufficient torque
Inspect as indicated in (1). (2) and (5).
(5) Motor takes longer to start.

| Trouble | Checkpoints | Remedy |
| :--- | :--- | :--- |
| Increased load\|check load. | Reduce load. |  |

(6) No speed arrival signal (UP-TO SPEED)

| Trouble | Checkpoints | Remedy |
| :--- | :--- | :--- |
| SE-101 card <br> output circuit <br> failure | Does LED7 on SE-CPU light <br> upon completion of accelera- <br> tion/deceleration? | Replace SE-101 card. |
| Failure in <br> speed arrival <br> detector <br> circuit | LED7 (UP TO SPEED) on SE-CPU <br> card does not light. | if-CPU card failure |

(7) No NC feed operation

This is caused by the failure of the UP TO SPEED signal to operate. Inspect in the same way as for the relay sequence and (6).
(8) No speed detection signal

| Trouble | Checkpoints | Remedy |
| :--- | :--- | :--- |
| SE-101 card <br> failure | Does SE-CPU card LED5 light <br> above set speed? <br> it lights, failure lies in <br> output circuitry. | Replace SE-101 card. <br> $\cdot$ |
| Speed detec- <br> tor circuit <br> failure | SE-CPU2 LEDS does not light. | SE-CPU card failure <br> if otherwise normal <br> operation; replace <br> card. |

(9) Nb zero speed detection signal

| Trouble | Checkpoints | Remedy |
| :--- | :--- | :--- |
| RA-1 relay | Does SE-CPU LED10 light at | Replace RA1 relay or |
| failed on SE- | motor speed of under 25 rpm | replace SE-101 card. |
| or So rpm? Relay has failed' <br> if signal is not output even |  |  |
| tector circuit <br> failure | if LED10 does not light. | Card. |

(10) No speed range selection

This is caused by the speed detection or zero speed signal
not functioning. Inspect as for (8) and (9).
(11) Speed does not increases beyond a certain value. Review settings to see whether maximum speed has been set properly. Check whether override input is not being supplied.

Is the load meter value too high? Check the load.
(12) High vibration, noise levels

| Trouble | Checkpoints | Remedy |
| :---: | :---: | :---: |
| Poor dynamic <br> balance |  | Review dynamic <br> balance. |
| Drop in insulation resistance | Disconnect R, S, T phases from power supply and meas with 500V megger (disconnect wires connected to ground terminals. <br> a Across main'circuitry and ground: 20Mohms or more (terminals $\mathrm{Xl}, \mathrm{X} 2, \mathrm{X}, \mathrm{U}$, V, W, MS1 and MS2) <br> b Across control circuit COM and ground; 20Mohms or'more (IO1 card, terminal block TB1 OM) <br> c Across main, circuity and control circuit COM: 20 Mohms or more | When this has dropure ped, inspect for places where insulation may have deteriorated, and restore. |
| Defective motor bearing | Does the motor rotate smoothly when it is rotated by hand? | Replace bearings. |

|  |  |  |
| :--- | :--- | :--- |
| Motor screws <br> not tight <br> enough | Are any of the motor screws <br> loose? | Re-tighten screws. |
| motor shaft |  |  |
| movement | Does motor shaft show any <br> trace of having been bumped <br> into something? | Repair or replace |
| motor. |  |  |
| reference sine | Are SE-101 card CH5, CM4-AGA <br> waveforms balanced? | eplace SE-101 card. |

(13) Speed control operates normally but trouble with orientation operation.

| Trouble | Checkpoints | Remedy |
| :---: | :---: | :---: |
| Orientation speed established but motor does not stop | Is position feedback encoder or magnetic sensor operating normally? <br> Operate motor under speed control only and check if position feedback.is normal. SE-CPU2 card, forward rotatiol -H52 - DCA <br> SH5 3 - DGA <br> 2H54 - DCA <br> Mark pulse) <br> SE-CPU 1 card, forward rotatior <br> :H53-AGA <br> IC 21A-7 - AGA | Replace detector. Or defective SECPU card interface: replace'card. |

| Trouble | Checkpoints | Remedy |
| :---: | :---: | :---: |
| Stop positions <br> differ for <br> forward orien- <br> tation and <br> reverse orien- <br> tation with <br> multiple-point <br> orientation. | Check backlash at encoder mounting area. |  |
| Hunting during stop | Increase 1st deceleration point range and observe result. | SE-SPU1 or 2 SW4-2-4 <br> (2nd deceleration point range) SW4-5-7 <br> (1st deceleration point range) SW10 <br> (Orientation speed) |
| Stop state <br> liffers <br> lecording to rear | :heck that gear ratio set:ing is normal. <br> JIP switch setting | ```Zhange if different. If normal, re-set st deceleration point range and orientation speed.``` |
| 'oor servo <br> -igidity | 'heck that gear ratio seting is normal. <br> IIP switch setting | increase speed loop zonstant. SW8 |
| Speed overihooting |  | Reduce speed loop :onstant. SW9 |

8.1 CARD REPLACEMENT
(1) SE-PW

Replace this card if something is wrong with the DC voltages.

The SE-101, CPU card must be removed in order to replace the card.
(2) SE-CPU1 card

First check the ROM number, DIP switch settings and setting pin positions again before proceeding with replacement.

Magnetic sensor sensitivity Orientation shift (VRI) $\quad$ controls.
(3) SE-CPU2 card

First check the ROM number, DIP switch settings and setting pin positions again before proceeding with replacement.
(4) SE-101 card

First check the setting pinpositions again before proceeding'
with replacement. When replacing the card, bear in mind
that the connectors hooking up the main circuitry are
located on the rear side of panel B.
CH56-AGA (U phase reference sinusoidal wave> . . . VR13.
CH43A-AGA regenerative converter DC current . . . VR10
CH57-AGA (V phase reference sinusoidal wave) . . . VR12
CH58-AGA converter DC current . . . VR11
Re-set the above zero adjustments.
0 Set the maximum speed using pin 1 on the 101 card and SW6-7 on .the CPU card.

0 Set the meter calibration SW6-6 to OFF and re-adjust VR6 and

7 so that the CH34 voltage is made 10 V .
For the 107 G54 edition and following, adjust VR6.
o After the above calibrations re-adjust the speed meter
(VR14) and load meter (VR15).
0 Upon completion of the re-adjustments, return the meter calibration SW6-6 to ON.
8.2 DIODE AND TRANSISTOR MODULES
(1) Removal of defective module

Detach the wires connecting the module and remove the module from the heat-dissipating fin.

In this case, bearing in mind that emitter pin $E$ and base pin B ofthetransistor module can be detached and reinserted, remove these pins.
(2) Application of silicon' grease

Apply an even layer of silicon grease to the rear side of the module.
(3) Tightening up

Restore the wires to their original state using the specified tightening torque. Cover the base and emitter pins of the transistor module with silicon tubes as before.

Note: Only the diodes and transistors listed in the specifications may be used. Replacements or spares must, therefore, be purchased from Mitsubishi or its authorized reoresentative.

Table 6.1 Tightening torques

|  | Model | Screw size | $\begin{gathered} \text { M a x . tighten- } \\ \text { ing torque } \\ (\mathrm{kg}-\mathrm{cm}) \end{gathered}$ | Recommended tightening torque (kg-cm) |
| :---: | :---: | :---: | :---: | :---: |
| $\begin{aligned} & \text { Dio- } \\ & \text { des } \end{aligned}$ |  | M5 $\times 0.8$ | 20 | - 17 +/-2 |
| Tran- sis- tors | $\left\lvert\, \begin{aligned} & \text { QM } 75 D Y-H \\ & \text { QM100DY-H } \\ & \text { QM150DY-H }\end{aligned}\right.$ |  |  |  |

-105-
6.3 TYPE SJ AC SPINDLE MOTOR DISASSEMBLY AND RE-ASSEMBLY
[1] Cables and P.c.board

1. Remove the cover of the terminal box on top of the fan case.
2. Disconnect the cables from the power board to the motor.
a) 3 motor main leads ( $U, V, W$ )
b) 2 cooling fan leads (BU, BV)
c) 2 thermal protector leads (OHS1, OHS2)
d) Companion plug for external
 connector.
3. Remove the external connector from the supporting plate and remove the internal cennector from the socket.
4. The P.C.board can be removed once the screw securing it is re moved.
5. For re-assembly., follow the above steps (1)-(4) in the reverse order.

Screw for securing
P.C.board P.C.board

## [2] Cooling fan

1. Remove the hexagon socket head bolts which secure the finger guard.

2. The fan olade can be removed once the screws at the center of the cooling fan are removed.
3. Cut the 4 cooling fan leads connected inside the terminal box. The fan motor can be removed from the fan case once the screws which attach it are removed.

4. For re-assembly, follow steps
(1)-(3) above in the reverse order.

## [3] Sensor and detection gear

1. Removethe internal connector
of the sensor from the socket inside the terminal box.
2. Remove the $\mathbf{3}$ hexagon socket head bolts attaching the fan case, and the fan case canbe removed once it is pulled out toward the rear.

3. Once the 2 screws
securing the sensor holder are removed, theholder can be removed-

Take care not to bring the sensor into contact with the detection gear while doing this.
4. To adjust the sensor, loosen the screw securing the sensor with the sensor holder secured and make the adjustment with a thickness gauge so that the gapbetween the detection gear and the sensor is made $\mathbf{0 . 1 5} \pm 0.01$.
Check if the marks (index lines) on the sensor and the holder be aligned,and tighten $u p$ the screws securing the sensor. (See figure on right)
5. Apply some screw locking agent on the screws for Preventing them from loosening.
6. When Fe-assembling the fan case, draw the sensor leads sufficiently into the terminal box so that they are not sandwiched between the bra-
 cket and the fan case.
7. The detect-ion gear is removed by screwing the eyebolt into the screw (M8) hole, drawing it out with a removal tool and then rotating the handle.

8. When re-assembling the detection gear, insert it into the shaft at a shrinkage fit temperature within 100-150 deg. C, taking care not to wrench it into place.

An excessively high Shrinkage fit temperature will cause distortion in the detection gear.

## [4] Bearings

1. The anti-load side bracket can be removed once the screws securing the housing cover and the hexagon socket-head bolts securing the bracket are all removed.
2. When re-assembling the anti-load side bracket, apply some sealing agent to the interlocking surface.
3. The anti-load side bearing is removed by removing the fixed ring type $c$, by using a bearing re. moval tool to remove the bearing

Apply sealing agent
\& Bolt securing bracket

Housrng cover screw

Fixed ring type $C$
along with the housing cover and by rotating the handle..
4. Remove the load side-bearing by. applying the pawl of the removal tool to its inner ring and rotating the handle.
5. To insert the bearing into the shaft, remove the wipe smears and projections from the insertion sections.
6. After applying grease on the inner surface of the bearing and the surface of the shaft,place the beaing on the shaft by pressing the inner ring with a pipe.

Care should be taken to keep the bearing be at right angles to the shaft.
7. If a press is unavailable,place the bearing on the shaft by tapping the inner ring gently with a hammer and apipe.

Care should be taken net to twist the bearing or not to hit the outer ring with the pipe.

## AC SPINDLE CONTROLLER \&MOTOR (TYPEFR-SE-2)

NOTE: Option spare parts A......⿰氵aintenance spare parts for every two years.
Option spareparts B ...... Џ\&intenance spare parts for every five years. Option spareparts C...... לaincenancespare parts for machine maker's stock.
